Hiring Team

NiCE Labs – AI Innovation

Re: AI Innovation Engineer (Requisition 11563)

Dear Hiring Team,

I am applying to the AI Innovation pillar at NiCE Labs. The loop you describe – spot a capability, build it, measure it against real metrics, then kill it or hand it off – is how I already work. At Viavi I prototyped 15+ AI applications from ambiguous requirements and carried 7 into production or paid client work; the other 8 were stopped, which was the right call and the reason the 7 shipped.

My fiancée lives in Berlin and we are making our home there, so a Berlin-based team is where I want to build. Cognigy interests me because conversational agents are where the gap between a promising model and a dependable product is widest, and closing that gap is the work. I have shipped LLM systems that real users depended on, not notebooks, and I have killed enough of my own prototypes to argue from evidence rather than enthusiasm.

Two things I would bring on day one. I build agent loops at the level below the framework – message arrays, tool calling, context management, prompt caching – and I designed the automated evaluation and observability pipelines for our Question Answering and Summary agents, with LLM evaluators and tracing that cut human review by 43%. I am also full-stack in practice: I built 21+ automated TypeScript and Next.js mockup generators that turn a ticket into a clickable React prototype, so I can take a concept from API to a demo UI that feels like a product without waiting on anyone, and I wire tools into agents over MCP.

Outside work I am building ThinkTree.AI, a non-profit AI learning platform used by NGO teachers to support students with ADHD. It is my own zero-to-one bet, shipped to real users and revised whenever their feedback contradicts my plan. I would welcome a conversation about the role.

Sincerely,

Abhinav Kaushik
